a practice dedicated to personalized child care from cradle to college

- ❖ Amherst Pediatric Associates highly recommends that your child follows the vaccine schedule recommended from the American Academy of Pediatrics and the CDC.
- ❖ Refusing vaccines and delaying the vaccine schedule puts your child and others at risk.
- ❖ In 2009 and 2010, there were measles, mumps, pertussis and HIB epidemics and deaths in this country. Diseases are coming back.
- ❖ 500,000 people in this country cannot be vaccinated due to medical conditions or treatment and your vaccinated child helps to protect these people.
- ❖ All of our vaccines are thimerisol (mercury) free.
- ❖ All of our own children and grandchildren have been fully vaccinated.
- ❖ Your child's immune system can easily tolerate multiple vaccines at the same visit.
- ❖ Vaccines have no connection to autism.
- ❖ Alternate vaccine schedules lead to delay in protection for your child and are not scientifically proven. Do not make your child a medical experiment.
- ❖ Pediatricians want their patients to remain healthy and do not want children to suffer infections.
- ❖ Vaccines are safe and work. The CDC, the American Academy of Pediatrics and many scientific and public safety groups are constantly monitoring the safety and effectiveness of the vaccine schedule.
- ❖ Vaccines are not big moneymakers for pharmaceutical companies or for pediatricians.
- ❖ Please trust your pediatrician and vaccinate your child fully.
